

DOM[Document Object Model]

- In the Dom Model we cannot give same id for element.
- So it making the confusion for the browser.
- So it takes the First position element.

#Program

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Document</title>
</head>
<body>
  <h1>Head 1</h1>
  <h2>Head 2</h2>
  <p>Paragraph 1</p>
</body>
</html>
```

- The Browser is will not be able to read or understand the **HTML** element because it is High Level programming Language it is only understandable only user.
- So the browser is responsible to create the **DOM**.
- The browser is created the **DOM** after loading the Html Elements.
- DOM** is a Graphical Representation of Document.[It creates the Tree like Structure].
- Each and every elements in the **DOM** has a index value.
- Each and every element is also called as **Node**.
- Using **DOM** we manipulate the Html tag at the Runtime.
